Goals in Misinformation

Timothy Kusuma
Overview

1. Motivation
2. Literature Review
3. Research Question
4. Method
5. Data Analysis
6. Conclusions
Motivation

- Social Media is a distribution center rapidly moving information from one source to another.
- Not all social media users are incentivized the same way.
- Do the motivations play into how people use information.
Literature Review

- Cheap Talk/ Bayesian Model
- Recent research has shown that people tend to only agree with and share information which is within their homogenous group (Vicario et. al., 2015).
- Often misinformation that does appear in these homogenous groups will be quickly argued down by members of the group quickly retweeting against fake news (Babcock et. al., 2018).
- Other research has shown that while homogeneous political groups are important, analytical thinking plays a major role in whether someone is able to discern whether information is fake or not (Pennycook & Rand, 2018).
- Building on this analytical thinking approach, other researchers find that goal setting can cause differences in the likelihood of seeking out information while those who are informatively driven to be more likely to ask for information (Ruth, 1993).
How do the goals when using social media impact the users desire to use less reliable information?

<tr>
<td>A.- Unemployment benefits are hurting our economy. This practice of paying people for no work creates a system of incentives preventing people from going to work, hurting small businesses in the process. These leftist policies need to be stopped.</td>
<td>B.- My view is you can have fairly high unemployment benefits without impacting employment.</td>
</tr>

| F.- Unemployment is a terrible program. If we look back at the great recession in 2008 we know that the increase in unemployment came from a minimal increase in unemployment benefits leading to 8.3 million more unemployed in 2010 and 6.8 million more unemployed in 2011. Stop this nonsense. Find more here.  
• Link not found | E. - The benefits from the Continued Assistance for Unemployed Workers Act only provides $300/week. But it costs on average $500,000 to raise a child, this is not enough money. There is no excuse for not raising unemployment. Find more here.

Conclusion

● Unable to find conclusive evidence could be many potential explanations:
  ○ People poor at filtering information.
  ○ (Vicario et. al., 2015).
  ○ Could be mistakes in the methods.

● Intercepts are significant pointing that people are willing to quote potentially dubious material.
Thank you
