Outline

◆□▶ ◆□▶ ◆目▶ ◆目▶ ● ● ●

- 1. Set-valued multi-class classification
- 2. Ambiguity and coverage
- 3. Least ambiguity with bounded error levels
- 4. Examples

Multi-class classification

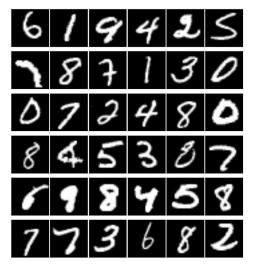

- Data: $(X_i, Y_i)_{i=1}^n \stackrel{iid}{\sim} P$ on $\mathscr{X} \times \mathscr{Y}$.
- Typically $\mathscr{X} \subset \mathbb{R}^d$, $\mathscr{Y} = \{1, ..., K\}$.
- Definitive classifier: for a given x ∈ X, predict ŷ = f̂(x) where f̂ is obtained from the data.

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• Bayes classifier: f^* minimizes $P(f(X) \neq Y)$ over all f.

Example: MNIST Data ($n \approx 7k$, d = 256)

MNIST Samples

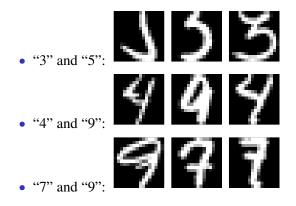

Some mis-classified samples

Method: logistic lasso with cross validation.

Observation: These samples are hard to classify, but further information can be given in addition to a single label.

Some mis-classified samples

Method: logistic lasso with cross validation.

Observation: These samples are hard to classify, but further information can be given in addition to a single label.

Set-valued classifiers

- Idea: instead of outputting a single ŷ ∈ 𝒴, output a subset H(x) ⊆ 𝒴.
- Also known as non-deterministic classifiers (del Coz et al, 2009).
- A related approach is classification with rejection (Chow, 1970; Herbiri and Wegkamp 2006), where the reject option can be viewed as outputting *H*(*x*) = 𝒴.

Evaluating set-valued classifiers

- Existing works typically optimize some modified objective.
 - *1*. Assign a loss between 0 and 1 to $H(x) = \mathscr{Y}$ (classification with rejection).
 - 2. Loss function is a combination of precision and recall (del Coz *et al*, 2009)

$$L_{\beta}(H(x), y) = \frac{1 + \beta^2}{\beta^2 + |H(x)|} \mathbf{1}(y \in H(x))$$

- コン・4回シュービン・4回シューレー

Ambiguity and Coverage

- For a set-valued classifier $H: \mathscr{X} \mapsto 2^{\mathscr{Y}}$, we define two competing criteria
 - Ambiguity: A(H) = E(|H(x)|)
 - Coverage: C(H) = P(Y ∈ H(X)), or class-specific coverage: C_y(H) = P(y ∈ H(X)|Y = y).
- A good classifier needs to cover the true class with high probability (high coverage), but outputs few classes (low ambiguity).
- Class-specific coverage is useful when classes are unbalanced.

The optimal classifier

Given $\alpha \in (0,1)$, define the *l*east *a*mbiguous classifier with *b*ounded *e*rror *l*evel (LABEL) as

$$H^* = \arg\min_{H} A(H)$$
 s.t. $C(H) \ge 1 - \alpha$.

Or the class-specific version: given $\alpha_y \in (0,1)$ ($y \in \mathscr{Y}$)

$$H^* = \arg\min_{H} A(H) \quad \text{s.t} \quad C_y(H) \ge 1 - \alpha_y, \ \forall y \in \mathscr{Y}.$$

The minimization is taken over all measurable mappings from \mathscr{X} to $2^{\mathscr{Y}}$.

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Characterization of the optimal classifier

Let $p_x(y)$ be the conditional probability of Y = y given X = x.

Theorem (Sadinle, L, Wasserman 2016)

For any $\alpha \in (0,1)$, the minimum of the overall LABEL problem is achieved by

$$H(x) = \{ y \in \mathscr{Y} : p(y|x) \ge t \}$$

with *t* chosen such that $P(Y \in H(X)) = 1 - \alpha$. For $(\alpha_y : y \in \mathscr{Y}) \in (0, 1)^{\mathscr{Y}}$, the minimum of the class-specific LABEL optimization problem is achieved by

$$H(x) = \{ y \in \mathscr{Y} : p(y|x) \ge t_y \}$$

with t_y chosen such that $P(y \in H(X)|Y = y) = 1 - \alpha_y$.

Connection to the Neyman-Pearson Lemma

• The characterization of optimal classifier can be viewed as a generalization to the Neyman-Pearson Lemma:

$$H_y = \{x \in \mathscr{X} : p_x(y) \ge t_y\}$$

where $H_y = \{x : y \in H(x)\}$ is the *y*-section of the classifier.

A hypothesis testing perspective: Given *x*, we test |𝒴| hypotheses (let *p_y*(·) be the density of *X* given *Y* = *y*)

$$H_{0,y}: X \sim p_y(\cdot)$$
 vs $H_{1,y}: X \sim p_{y'}(\cdot)$ for some $y' \neq y$.

• The optimal classifier consists of all the level $1 - \alpha_y$ non-rejection regions.

A useful lemma

Lemma (minimize incorrect labeling)

The optimal classifier also minimizes $P(y \in H(X) | Y \neq y)$ for all $y \in \mathcal{Y}$.

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

A plug-in estimate of optimal classifier

- Let $\hat{p}_x(y)$ be estimated conditional density of x given y.
- Let $\hat{t}_y = \hat{F}_y^{-1}(1-\alpha)$, where \hat{F}_y is the empirical CDF of $\{\hat{p}_{x_i}(y) : Y_i = y\}$.
- The plug-in estimate is

$$\hat{H}_y = \left\{ x : \hat{p}_x(y) \ge \hat{t}_y \right\}.$$

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Estimation Accuracy

Let $G_y(\cdot) = P(p_X(y) \le \cdot | Y = y)$ be the CDF of $p_X(y)$ given Y = y.

Theorem

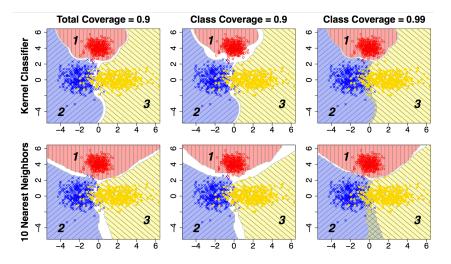

Assume $P(\sup_{x} |\hat{p}_{x}(y) - p_{x}(y)| \le \varepsilon) \le \delta$ for all *y*, and $c_{1}|s|^{\gamma} \le |G_{y}(t_{y} + s) - G_{y}(t_{y})| \le c_{2}|s|^{\gamma}$ for all $s \in [-s_{0}, s_{0}]$, then with probability at least $1 - |\mathscr{Y}|\delta - cn^{-1}$ we have

$$P(X \in \hat{H}_{y} \triangle H_{y} | Y = y) \le c \left(\varepsilon^{\gamma} + \sqrt{\log n/n} \right), \quad \forall y.$$

Remark: one can weaken the sup norm consistency condition on $\hat{p}(y|x)$ to consistency near the cut-off value.

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Example: three-component Gaussian mixture

▲ロト▲圖ト▲画ト▲画ト 画 の文(で)

What if $H(x) = \emptyset$?

- If α_y 's are too large, $\bigcup_y H_y$ may not equal to \mathscr{X} .
- If $x \in \left(\bigcup_{y} H_{y}\right)^{c}$, then $H(x) = \emptyset$.
- We call $N = \left(\bigcup_{y} H_{y}\right)^{c}$ the "null set".
- Sometimes *N* corresponds to points that look like outliers, but sometimes it corresponds to points that are highly ambiguous.

What if $H(x) = \emptyset$?

- If α_y 's are too large, $\bigcup_y H_y$ may not equal to \mathscr{X} .
- If $x \in \left(\bigcup_{y} H_{y}\right)^{c}$, then $H(x) = \emptyset$.
- We call $N = \left(\bigcup_{y} H_{y}\right)^{c}$ the "null set".
- Sometimes *N* corresponds to points that look like outliers, but sometimes it corresponds to points that are highly ambiguous.

Lemma

If $\sum_{y} t_{y} \le 1$, then $N = \emptyset$. (Recall that $\hat{H}_{y} = \{x : \hat{p}(y|x) \ge t_{y}\}$.)

The Accretive Completion Algorithm

Idea: gradually reduce t with minimal incremental ambiguity

Require: $t^{(0)} = (t_1^{(0)}, \dots, t_K^{(0)})$ from the initial estimate, step size η $s \leftarrow 0$ while $\sum_y t_y^{(s)} > 1$ do for $y = 1, \dots, K$ such that $t_y^{(s)} - \eta t_y^{(0)} > 0$ do $A_y \leftarrow$ empirical ambiguity using $t_1^{(s)}, \dots, t_y^{(s)} - \eta t_y^{(0)}, \dots, t_K^{(s)}$ end for

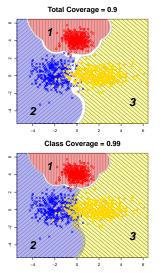

$$y^{*} \leftarrow \arg\min_{y: t_{y}^{(s)} - \eta \ t_{y}^{(0)} > 0} A_{y}$$

$$t^{(s+1)} = (t_{1}^{(s)}, \dots, t_{y^{*}}^{(s)} - \eta \ t_{y^{*}}^{(0)}, \dots, t_{K}^{(s)})$$

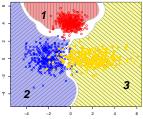

$$s \leftarrow s + 1$$

end while
return $t^{(s)}$

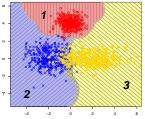

Example using kernel classification (cont'd)

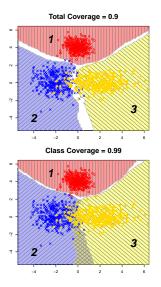

Class Coverage = 0.9

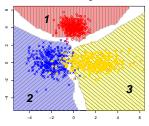

Accretive Completion, Class Coverage ≥ 0.99

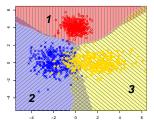

Example using 10-NN classification (cont'd)

Class Coverage = 0.9

Accretive Completion, Class Coverage ≥ 0.99

MNIST Data

Goal: classify hand-written digits

MNIST Samples

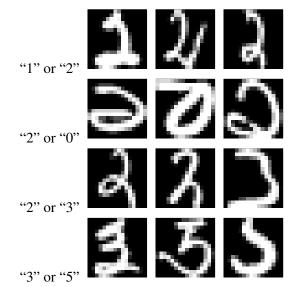

MNIST Data, cont'd

- We use kNN classifier with *k* = 10 chosen by three-fold CV on the training sample.
- Target class-specific coverage levels at 1 0.05.
- 2/3 of the training sample is used to fit p(y|x), remainder for estimating the quantiles.

	$ \mathbf{\hat{H}}(X) $				
	1	2	3	≥ 4	$\widehat{\mathbb{E}}{\{\hat{\mathbf{H}}(X)\}}$
Test sample frequency	1918	87	2	0	1.045

Ambiguous images reported by the algorithm

Summary

- New criteria for evaluating set-valued classifiers: coverage and ambiguity
- Optimize ambiguity subject to coverage constraints, and a generalized Neyman-Pearson Lemma.
- Accretive completion to remove null set.
- Flexible and transparent choice of parameters in the algorithm.
